APPLICANT: JOHNSON, GRAHAM

Application No.: 10/027,364

Filing Date: 12/20/01

For: CHANNEL SELECTION PROCEDURE FOR  
MOBILE COMMUNICATION DEVICES

Art Unit: 2681

TRANSMITTAL OF PRIORITY DOCUMENT

Director for Patents and Trademarks  
Washington, D.C. 20231

RECEIVED

MAR 20 2002

Dear Sir:

Technology Center 2600

Enclosed herewith is a certified copy of British Patent Application No. 0031174.6  
for which the above-identified patent application claims priority from.

If, for any reason, this priority document is not acceptable, please inform the  
undersigned as soon as possible.

Respectfully Submitted

HEAD, JOHNSON & KACHIGIAN

Date: 03/15/02

Customer No. 24,118

  
Mark G. Kachigian, Reg. No. 32,840  
228 West 17th Place  
Tulsa, Oklahoma 74119  
(918) 584-4187  
Attorney for Applicant

"EXPRESS MAIL" Mailing Label No. EL779649893US

Date of Deposit: March 15, 2002

I hereby certify that this paper or fee is being deposited with the United States Postal Service "Express Mail Post Office to Addressee" service under 37 CFR 1.10 on the date indicated above and is addressed to the Commissioner of Patents and Trademarks, Washington D.C. 20231 by Amy Miles.

The Patent Office  
Concept House  
Cardiff Road  
Newport  
South Wales  
NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

# Request for grant of a patent

(See the notes on the back of this form. You can also get an explanatory leaflet from the Patent Office to help you fill in this form)

1. Your reference GW-G30597

2. Patent application number 21 DEC 2000 0031174.6  
(The Patent Office will fill in this part)

3. Full name, address and postcode of the or of each applicant (underline all surnames) Pace Micro Technology Plc

Victoria Road  
Saltaire  
Shipley  
BS18 3LF

Patents ADP number (if you know it)

If the applicant is a corporate body, give the country/state of its incorporation

21DEC00 E593269-1 D00346  
G.B P01/7700 0.00-0031174.6

4. Title of the invention Channel Selection Procedure for Mobile Communication Devices

5. Name of your agent (if you have one) Bailey Walsh & Co.  
"Address for service" in the United Kingdom to which all correspondence should be sent (including the postcode) 5, York Place  
Leeds  
LS1 2SD

Patents ADP number (if you know it) 224001

6. If you are declaring priority from one or more earlier patent applications, give the and the date of filing of the or of each of these earlier applications and (if you know it) the or each application number	Country	Priority application number (if you know it)	Date of filing (day / month / years)

7. If this application is divided or otherwise derived from an earlier UK application, the earlier application	Number of earlier application	Date of filing (day / month / years)

8. Is a statement of inventorship and of right to grant of a patent required in support of this request? (Answer "Yes" if:

Yes

a) any applicant named in part 3 is not an inventor, or

b) there is an inventor who is not named as an applicant, or

c) any named applicant is a corporate body

See note (d)

9. Enter the number of sheets for any of the following items you are filing with this form.  
Do not count copies of the same document.

### Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

### Notes

- If you need help filling in this form or you have any questions, please contact the Patent Office on 0645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in this form you must remember to sign and date it.
- For details of the fee and ways to pay, please contact the Patent Office.

## Channel Selection Procedure for Mobile Communication Devices

This invention relates to the selection of a frequency of operation for Mobile Communication apparatus which utilise a communication system such as, but not necessarily exclusively, the system known as "Bluetooth" (RTM.)

Mobile Communication Devices are increasingly widespread and one form of communication system which will increasingly be utilised is the Bluetooth system which allows the transmission of data between devices in a particular range using specific frequencies of transmission through which the devices can communicate. It is also important to note that Bluetooth devices must use the same set of frequencies in order for the two devices to communicate together as typically the frequency channel which is used from the list of available channels is determined by a pseudo random "hopping sequence" controller until an appropriate and available channel is selected.

A problem arises however, in that if the devices are required to be used in different countries frequencies which can be used in one country may not be permissible in other countries. This means that while a frequency may be available for use in one country, in another country the same frequencies may be illegal.

Currently, devices which utilise Bluetooth use frequency hopping techniques over a defined set of frequencies. These frequencies vary depending on the country of operation. Typically, 79 possible frequencies are in theory available, but some of the 79 frequencies are used by incumbent services like military and emergency services in countries such as France, Spain, Japan. In these countries it is typical that 23 of the

channels are used but, to further complicate matters different groups of 23 channels are used in different countries.

Unlike other fixed frequency systems such as IEEE802.11 or HomeRF where the devices are country-coded and hence fixed on a set of frequencies which can be used in that country, Bluetooth-enabled mobile phones can easily cross borders with their users and, as such, at the present time the user has to reconfigure the device to use the correct set of frequencies for each country.

In the first instance, this is impractical, but also, and perhaps more critically, if the user forgets to make this adjustment then the device can potentially use illegal frequencies and cause jamming to critical services, and/or lead to prosecution of the unwitting user.

The aim of the present invention is therefore to provide a method of controlling the frequencies used by Bluetooth enabled devices with respect to local operating conditions.

In a first aspect of the system the GSM network information is used to determine where the device is in terms of geographical location and via software provided within the device configure the device accordingly to avoid use of illegal frequency channels, in the identified geographical location.

Typically the configuration is performed with respect to the frequency values stored in a memory at which the device can operate and with respect to specified and identifiable geographical locations.

Typically, mobile phone network cell identification data can be used by the device software to determine where the device is at

any time (geographically). With this information the software can then automatically configure the device to select either of a 79 or 23-channel hop sequence and, in turn specify a specific 23 channel hop sequence for the correct group of 23 channels for the geographical location.

In one embodiment, the device can contain in memory a look-up table which correlates cell-Ids to country-codes or other geographical regions or the mobile network may directly transmit a country-code to the device which requires less local memory in the device and as the network can transmit the appropriate data once the geographical location is identified.

A specific embodiment of the invention is now described with reference to the accompanying drawings, wherein:-

Figure 1 illustrates channel frequencies used for various countries.

In the use of Bluetooth or an equivalent communication system a specific frequency range is allocated for operation. In the case of the Bluetooth system this operates in the 2.4GHz ISM band and, although globally available, the exact location and permitted usage of the band varies from country to country.

Operating bands for a number of different geographical locations, in this case on a country by country basis, are identified and illustrated in Figure 1. For example, in the US and most European countries a band of 83.5 MHz width is available and in this band, 79 RF channels (k) spaced 1MHz apart are defined.

However in Spain, France and Japan, a smaller band width is available and is located within the ISM band. In the available

band 23 RF channels  $k$ , spaced 1MHz apart, are defined but the 23 bands which are defined are not in the same location for each country as the location of the band can vary.

Thus in order to achieve a communication channel between two devices, a pseudo random hopping sequence is used to move through the 79 or 23 channels to select an appropriate channel for use. In order to do this the channel is divided into slots where a different hop frequency is used for each slot and the hop rate for Bluetooth systems is 1600 hops per second. One packet of data can be transmitted per slot and subsequent slots are subsequently used for transmitting and receiving and this results in a Time Division Duplex (TDD) scheme. Two or more units sharing the same channel form a piconet where one unit acts as a master controlling the piconet and the other units act as slaves.

The frequency hop channel which is selected is determined by the frequency hop sequence and by the phase in the sequence. In the Bluetooth system the sequence is determined by the identity of the piconet master and the phase is determined by the master unit's clock system. The repetition interval of the frequency hop is relatively long at typically 23 hours or more.

Thus in accordance with the invention the frequency hop sequence which is selected to be used is selected in relation to the geographical location of the device which is first detected in accordance with the invention.

Typically 10 selectable hopping sequences are defined in accordance with the invention for selective use with respect to the detected geographical location of the device, five for the 79 channel hop sequence and 5 for the 23 channel hop sequence.

Thus, in a practical example of the invention, a user of a mobile device such as a mobile telephone, purchases the device in a first country. The device is Bluetooth enabled thus allowing the same to be utilised with a Bluetooth communication system and other enabled devices within a certain area.

In the country of purchase it is unlikely that the user will experience any problem as the device will be sold to be operable in the frequency range channels permitted in the country of purchase. However it should be noted that the invention as herein described could be utilised to provide the initial set-up frequency channels of operation for the first country at the time of purchase.

In any case, if the user moves, with the device, to another geographical location and in particular to a second country, there is a risk that the operating frequency previously used is illegal or otherwise prevented in the second country. In accordance with the invention, the GSM cell location for the device is identified at intervals of use and at the first time of operation of the device at a new geographical location this is sensed. Once the location is identified by the device control system or the GSM network, if the location requires a different frequency channel operating sequence to the location of previous use so the operating characteristics in terms of the selection of an appropriate channel hop sequence for that geographical location can be adjusted accordingly.

Thus the invention ensures that Bluetooth enabled devices and other devices enabled for use at particular frequencies in particular countries in general, are using the correct frequencies as set out by local geographical and/or country regulations and avoids the illegal use of the frequencies.

In preferred embodiments the invention is transparent to the device user inasmuch that automatic selection of the appropriate sequence from the possible 79 or 23 channel hopping sequences is made for the specific location. Furthermore the selection can be made without need for user intervention/set-up.

Figure 1

Geography	Regulatory Range	RF Channels
USA	2.400-2.4835 GHz	$f=2402+k$ MHz, $k=0, \dots, 78$
Europe (except Spain and France)	2.400-2.4835 GHz	$f=2402+k$ MHz, $k=0, \dots, 78$
Spain <sup>1)</sup>	2.445-2.475 GHz	$f=2449+k$ MHz, $k=0, \dots, 22$
France <sup>1</sup>	2.4465-2.4835 GHz	$f=2454+k$ MHz, $k=0, \dots, 22$
Japan <sup>2)</sup>	2.471-2.497 GHz	$f=2473+k$ MHz, $k=0, \dots, 22$
